## IN THE CLAIMS:

801-531-9168

This listing of claims will replace all prior version, and listing, of claims in the application. Claims 5-7 have been canceled with prejudice or disclaimer.

- (Withdrawn) A process for the hot moulding of articles made of thermoplastic 1. material, comprising the steps of:
  - heating at least one plate of thermoplastic material to a plasticizing temperature;
- compressing said heated plate between two moulding surfaces, set opposite one another, of a pair of half-moulds; and
- forming, by injection moulding, at least one component anchored to a surface of the plate, while the plate is being compressed between said moulding surfaces.
- 2. (Withdrawn) A process according to Claim 1, wherein the injection moulding of the aforesaid component is performed by injecting plastic material at high pressure into a scat communicating with one of said moulding surfaces.
- (Withdrawn) A process according to Claim 2, wherein said seat presents a narrow 3. section designed to produce a reduction in the pressure of the plastic material injected in contact with the plate,
- (Withdrawn) A process according to Claim 1, comprising the step of displacing a slider defining one part of said seat for extracting the injection-moulded component from the respective seat.

Claims 5-7 (Canceled)

PAGE 07/11

- 8. (New) Equipment for hot moulding of articles made of thermoplastic material, comprising:
- a first half-mould and a second half-mould which are movable with respect to one another between an open position and a closed position and are provided with respective compression moulding surfaces designed to apply a moulding pressure on at least one plate of thermoplastic material, following upon movement from the open position to the closed position,
- at least one injection-moulding seat in at least one of said half moulds, the injectionmoulding seat communicating with the respective moulding surface,
- at least one injection channel provided for injection plastic material inside said injectionmoulding seat,
- at least one narrow section between the injection-moulding seat and the respective moulding surface designed to reduce the pressure of the plastic material injected in the injectionmoulding seat in contact with said plate.
- (New) Equipment according to Claim 8, wherein said at least one narrow section 9. is provided at a location where the injection-moulding seat communicates with the respective compression molding surface.
- (New) Equipment according to Claim 8, comprising a slider movable with 10. respect to the respective half-mould, the slider having at least one injection moulding surface forming at least one wall of said injection-moulding seat.
- (New) Equipment according to Claim 10, wherein said narrow section is 11. provided between said slider and said half-mould.
- (New) Equipment according to Claim 10, wherein the slider has a compression 12. moulding surface forming a portion of the compression moulding surface of the respective halfmould.

13. (New) Equipment according to Claim 11, wherein said narrow section is provided at a location in which the compression moulding surface of the slider communicates with the injection moulding seat.
